Interaction. The hPSP DNA is useful for chromosome identification and isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting).

Consider the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting).

Consider the corresponding genomic DNA. The DNA and protein can be maplification or immuno assays), particularly for diagnosis of diagnosis of cancers of the saltwary gland, thymus and application is diagnosis of cancers of the saltwary gland, thymus and pancreas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibocerial, antiporasitic and antiviral agencia and may be expressed in vivo from the DNA. The protein, or cells carbagonists, e.g. antibodies (Ab), polypeptides and antisense nucleic acids which are potentially useful for treating conditions associated to the express the recombinant protein and this can be used to express the recombinant protein and this can be used to raise Ab, useful for diagnosis, therapy, for affinity purification and to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Parotid secretory protein; human; cancer; autoimmune disease; secretory tissue; gastrointestinal tissue; HSPSP, Sjorgen's syndrome; Graves disease; thyroidlis; insulin-dependent diseets; pancreatitis; ulcerative colitis; Crohn's disease; atrophic gastritis.

This represents a human parotid secretory protein (HPSP). Antagonists that bind specifically to, and modulate activity of HPSP are used to granteet cancer and autolimume diseases particularly of secretory or gastrointestinal tissue, e.g. cancer of salivary gland, thyroid, prostate, breast, gastrointestinal tract or pancreas, Sjorgen's syndrome, Graves disease, thyroiditis, insulin-dependent diabetes, pancreatitis, ulcerative colitis, Crohn's disease and atrophic gastritis. Host cells containing expression vectors comprising the HPSP nucleic acid are used to produce recombinant HPSP which is used to generate antibodies and to screen for its antagonists. Antibodies are useful directly as antagonists, to transport drugs to HPSP-expressing cells, to detect cells that express HPSP, to monitor patients being treated with HPSP, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to detect HPSP-encoding sequences (optionally after amplification by PCR) by hybridisation, particularly for diagnosis and monitoring of disease, but also for mapping the chromosomal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            purification of HPSP from natural sources. Expression of HPSP may indicate cell proliferation. HPSP nucleic acid or its fragments are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 DLGVLQKSSAWQLAKQKAQEAEKLLNNVISKLLPTNTDIFGLKISNSLILDVKAEPIDDG 120

PRO genes. Exemplary conditions or disorders to be treated with supplicing antibodies and other compounds include benign or malignant tumours (e.g., renal, liver, kidney, bladder, breast, gastric, ovarian, colorectal, prostate, pancreatic, lung, vulva, thyroid, hepatic carcinomas, sarcomas, glioblastomas, and various head and neck tumours), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalanic and other glandular, macrophagal, epithelial, stromal and blastocoelic disorders, and inflammatory, angiogenic and immunologic disorders. AAC5816 represent PCR primers and hybridisation probes used in the isolation of the human PRO sequences. AAC5836 to AAC5836 represent human PRO polynucleotide and protein sequences given in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated antibody that binds to one of the human PRO proteins designated PRO212, PRO390, PRO311, PRO535, PRO619, PRO717, PRO809, PRO8103, PRO9183, PRO91025, PRO1030, PRO1093, PRO9107, PRO1111, PRO1133, PRO1109, PRO1083, PRO9105, PRO1184, PRO2145, PRO1184, PRO5145, PRO5145, PRO5161, PRO513, PRO31710, PRO2094, PRO3145 OR PRO2198, PRO antagonists can be used to inhibit tumour cell growth. The PRO polypoptides and nucleotides are useful in the treatment, disagnosis and prevention of cancer. The antibodies and other anti-tumour compounds maybe used to creat various conditions, including those characterised by overexpression and/or activation of the amplified
                                                  Human; tumour; diagnosis; neoplastic disease; neoplastic cell growth; proliferation; tumourigenesis; identification; cancer; cytostatic; neotropic; neuroprotective; antiinflammatory; immunosupressive; immunostimulant: antianglogenic; leukaemia; lymphoid malignancy; neuronal disorder; glaid disorder; astrocytal disorder; angiogenic; hypothalantc disorder; glandular disorder; macrophagal disorder; inflammatory disorder; immunologic disorder; inflammatory disorder; immunologic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Thirty PRO polynucleotides encoding PRO polypeptides, useful in the

This sequence represents a human secreted protein amino acid sequence. The invention relates to sequences AAARY125-AB774 which encode human secreted proteins AAB25763-B25812. The proteins include signal peptides. Included in the invention are a host cell containing one of the cDNA sequences, and a purified antibody capable of binding to one of the sequence data on a computer system, and a methods for storing the sequence data on a computer system, and a method for identifying features of the CDNA sequences using a computer programme. The CDNAs are useful for expressing secreted proteins or fragments to obtain antibodies capable of specifically binding to the secreted
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotides and polypeptides encoding proteins with signal peptides, useful in diagnostic, forensic, gene therapy and chromosome

proteins. The cDNAs may also be useful in diagnostic, forensic, gene therapy and chromosome mapping procedures and may be used to design expression vectors and secretion vectors. The proteins of the invention may be used to treat diseases including cancer, autoimmune diseases, cardiovascular disorders, cystic fibrosis, hypothyroidism, immunological disorders, amyloidosis, brain disorders, skeletal muscle disorders, eye disorders, obesity, mitochondriocytopathies, diabetes, atherosclerosis, neurodegenerative disorders, graft rejection, Alzheimer's disease, dementia, hyperlipidaemia, septic shock and impotence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ŏ
    AAM2563. The proteins can have activities based on the tissues and cells they are expressed in, such as: antinifammatory; antinheumatic; cells they are expressed in, such as: antinifammatory; antinheumatic; cardiantstructs; immunosuppressive; antibacterial; endocrine; cardiant; cardianeamic; antibacterial; endocrine; cardiant; cardianeamic; antibacterial; endocrine; cardiant; cardianeamic; antibacterial; antimaterial; antibacterial; outperformatic) antidabetic; oytostatic; neuroprotective; antidapressant; nootropic; antidaprexisonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production, The proteins and polynucleotides are useful for screening for agonists or antigonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunocytices, neurodegenerative and incombined inclusions, adderess, parkinson's disease, neurodegenerative and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

Human brain expressed single exon probe encoded protein SEQ ID NO: 34413.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 27; SEQ ID NO 34070; 639pp + sequence listing; English.

probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leuksemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide #9264 encoded by probe for measuring placental gene expression.
                                             The present invention provides a number of single exon nucleic acid

The proteins which play a major role in induction of growth, cell migration and proteins which play a major role in induction of growth, cell migration and proliferation, cell-cell interaction and the differentiation of tissue specific cells. These proteins are important in the maintenance of tissue integrity and thus are important in wound healing. They are useful in various assays to determine the biological activity, to raise anticonedies, to guantitatively determine bevels of interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or states. Compositions comprising the novel proteins of the invention are useful in genome and physical mapping, in positional cloning of are useful in genome and physical mapping, in positional cloning of genes, to tag or indentify an organism or its reproductive material (as non-disruptive tags for marking organisms), and for the diagnosis and treatment of mammalian diseases which is the consequence of inappropriate expression of kinase genes. They are useful for promoting immune response as part of a vaccine or anti-cancer treatment, as immunoregulatory and anti-inflammatory molecule, as anti-cancer treatment, and as a starget for antagonists in the treatment of diseases such as asthma and allergy. They are also useful to inhibit or enhance the activity of the soluble molecule that binds proteins of the invention, for tissue and neural regeneration, to promote or block cell trafficking, and as anti-inflammatory and/or vaccine adjuvant.

The present sequence is 28.6 kba protein, a secreted protein from mouse.

The sequence is predicted from a full-length cDNA clone (see AAX59356) isolated from a human adult brain (thalamus) cDNA library. The invention provides cDNA clones (see AAX59352-58)

encoding novel secreted proteins (see AAY06404-10) of the human tests, brain and foetal kidney. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data are provided. Suggested activities include nutritional, cytokine, cell provided. Suggested activities include nutritional, cytokine, cell vaccine) or immunosuppressive, haematopoiesis regulating, tissue affectivit or inhibin; chemotactic or chemokinetic, haemostatic, thrombolytic, receptor/ligand, antiinflammatory, cadherin or tumour invasion suppressor, and tumour inhibition

Sequences AAM95463-47) represent LS170 polypeptide fragments which contain at least on epitope in their sequences. The present invention relates to detection of a target LS170 polynucleotide that comprises treating a test sample with at least one LS170 specific nucleic acid that with any of the sequences (AAX080109) are fragments derived from various clones of LS170 gene. The LS170 overlapping sequences transcribed from lung tissue. They are used for diagnosis, staging, monitoring, in vivo imaging, prevention and treatment such disease. Particularly detection of LS170 polynucleotide, IS170 or ling disease. Particularly detection of LS170 polynucleotide, IS170 cantigens, or anti-LS170 antibodies is indicative of disease. Cells sequences are used to expression system comprising the LS170 nucleic acid care used to expression system comprising the LS170 nucleic acid sequences are used to express recombinant polypeptides. The polypeptides can be used to express recombinant polypeptides. The polypeptides can be used to isolate related sequences; as standards and reagents in therapeutic agents (by neutralising LS170 related nucleic acid assays; as targets for drug screening, and as components or targets for used to deliver therapeutic agents (by neutralising LS170 polypeptides); in competitive binding drug screens, and to generate anti-idiotypic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          75 KQKAQEAEKILUNVISK---LLPTNTDIFGLKISNSLILDVKAEPIDDGKGLNLSFPVTA 131

Lung specific genes for developing products for diaynosing, monitoring, staging, prognosticating, imaging and treating lung cancer
                                                                                                                                                                                                 The present sequence is encoded by a lung specific gene, designated Lug110, clone ID 1355520, gene ID 236760. The specification describes methods for diagnosing the presence of lung cancer in a patient. The method comprises measuring levels of lung specific genes in cells, tissues or bodily fluids, and comparing the level to that of a normal human control. The methods can be used for diagnosing, monitoring, staging or prognosticating lung cancer. Sepecially metastatic lung cancer. Antibodies against proteins encoded by lung specific genes can be used for imaging or, when conjugated to a cytotoxic agent, for
                                                                                                                                                          Example 2; Page 35-36; 37pp; English.

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation acilvity or may induce production of other or cell differentiation acilvity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune auticiacides and disorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus erythematosus, rhemmatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (GVHD), in the induction of tumour immunity, myeloid or lymphoid cell deficiencies, wound healing and tissue repair, in the treatment of burns, incisions and uncers; as well as in treatment of periodontal disease, diseases of the peripheral nervous system, amploing lateral sclerosis or osteoarthritis, mediated by infanction of cardiac and central nervous system vessel e.g. stroke, amplotrophic lateral sclerosis, and Shy-Darger syndrome, infections, infanction of cardiac and central nervous system vessel e.g. stroke, sepsis, infiammatory bowel disease, uncers, bone regeneration. The protein, having activin- or inhibin-relaced activities is useful as a contraceptive based on the ability of inhibins to decrease fertility in female mammals and decrease spermatogenesis in male mammals. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   78 kpgggtsggllggllgkvtsvipglnnildikvtdpqllelglvgspdghrlyvtiplgi 137

J. Bacteriol. 175:7497-7499(1993).
J. CATALIVIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone phosphate + D-glyceraldehyde 3-phosphate.
PATHWAY: SIXTH STEP IN GLYCOLYSIS.
J. PATHWAY: BELONGS TO CLASS 1 FRUCTOSE-BISPHOSPHATE ALDOLASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SCHIFF-BASE WITH DIHYDROXYACETONE-P
